

Microprocessors lab ECSE426

Lab 1 Demo sheet

Group No:

Student Name:	Student ID:	Grade:	/6
Student Name:	Student ID:	Grade:	/6
Student Name:	Student ID:	Grade:	/6

1. **Demonstrate correct functionality of the code as follows:** (1.5 marks)

- The outputs of the assembly Viterbi function matches the TA outputs (0.5 mark)

- The outputs of the C Viterbi function matches the TA outputs (0.25 mark)

- The assembly and C function prototypes match the ones listed in the experiment. The *struct* definition matches the one in the lab sheet. No dynamic memory allocation or unnecessary pointers. (One mistake loses all) (0.25 mark)

- Assembly subroutine adheres to the calling convention and gives correct output if called from within C (0.25 marks)

- Correct test benches and initialization subroutines (in assembly and C) (0.25 marks)

2. **Coding requirements and optimization** (2.5 marks)

Grades awarded based on best results between groups. (Top 5 groups get highest mark, second top 5 groups get 75% of this part's mark ...etc.)

Set simulation speed at 25MHz.

- Execution time of assembly Viterbi function for one observation is (_____ μ sec) (1 marks)
- Execution time of C Viterbi function for one observation is (_____ μ sec) (0.75 marks)

- Efficient use of registers, number of Rx registers used (____), number of Sx registers(____) (0.5 mark)
- Efficient and correct use of either data or stack memory (0.25 mark)

3. C and assembly implementations discussion. Students should explain the code clearly and their instruction choices. Students must answer any question the TA asks related to project structure / Start-up files / Assembly functions / stack or data memory / calling convention / C-implementation / Assembly implementation **(Individual not group mark)**

- Student 1 _____ (1.5 marks)

- Student 2 _____ (1.5 marks)

- Student 3 _____ (1.5 marks)

4. Code documentation. Use of clear functional comments in both assembly and C **(0.5 mark)**

Bonus **(0.5 mark)**

1. Re-implementation of code in CMSIS-DSP and understanding the API and rationale behind using these functions (0.25 mark)

2. Correct output of the CMSIS DSP for the test vector that matches the non-DSP implementation (0.25 mark)
